

01/21 01/21 information from the information carrier; and [including]
[verification] means for verifying the relationship between
the second bit pattern and the first bit pattern.

- 2. (thrice amended) The system of claim 1, in which the relationship includes a cryptographic [one-way] function.
- 3. (thrice amended) The system of claim 2, in which the [second bitpatte:n is generated by applying] relationship includes a one-way function [to the first bitpattern].
- 4. (twice amended) The system of claim 1, in which the second bitpattern identifies the encoder means.
- 5. (thrice amended) A recorder [for recording information on an information carrier having a medium mark representing a first bitpattern, the recorder] comprising:

[generator] means for generating a second bitpattern according to a predefined relationship to [the] a first bitpattern represented on a record carrier by a medium mark; and encoder means for embedding a watermark representing the second bitpattern in [the] user information to be recorded; and means for recording the watermarked user information on the record carrier.

- 6. (thrice amended) The recorder of claim 5, in which:
 the recorder further comprises marking means for [creating]
 writing the medium mark on the information carrier; and
 the [generator] generating means [includes means for
 generating] generate the first bitpattern from a seed according
 to a further predefined relationship.
- 7. (thric: amended) The recorder of claim 5, in which the [generator] generating means generate the first bitpattern by combining a first part represented by a prepressed mark on a

0615

recordable information carrier and a second part generated from the seed.

- 8. (twice amended) The recorder of claim 6, in which the further predefined relationship includes a cryptographic one-way function.
- 9. (twice amended) An information carrier comprising:
 a medium mark representing a first bitpattern; and
 recorded information including a watermark representing a
 second bitpattern having a predefined relationship to the first
 bitpattern.
- 10. (twice amended) The information carrier of claim 9, in which the first bitpattern includes:
- a first part identifying a source of the information carrier; and
 - a second part identifying the recorded information.
- 11. (thrice amended) A player comprising:

 mears for reproducing user information from a record
 carrier;

first means for [detecting] reading a medium mark representing a first bitpattern [in information reproduced] from [a] the record carrier;

[watermark read] <u>second</u> means for detecting a second bitpattern represented by a watermark in the reproduced <u>user</u> information; and

verification means for verifying a predefined relationship between the second bitpattern and the first bitpattern.

- 12. (twice amended) The player of claim 11, in which the verification means includes a cryptographic one-way function.
- 13. (thrice amended) The player of claim 12, in which:

the verification means [are arranged for generating]

generate a verification pattern by applying a one-way function to
the firs: bitpattern; and

the verification means [include means for comparing] <u>compare</u> the verification pattern and the second bitpattern <u>in order to verify the predefined relationship</u>

14. (twice amended) The system of claim 1, in which:

the relationship includes a [cryptographic] one-way function

the [second bitpattern is generated by] relationship includes [applying the] a cryptographic [one-way] function [to the first bitpattern]; and

the second bitpattern identifies the encoder means.

15. (twice amended) The recorder of claim 5, in which: [the recorder further comprises means for recording the watermarked information on the record carrier;]

the recorder further comprises means for reading from a record carrier a first bit pattern indicating a copy protection status of the record carrier:

the [predefined] relationship includes a cryptographic [one-way] function;

the [second bitpattern is generated by applying the] relationship includes a one-way function [to the first bitpattern];

the second bitpattern identifies the encoder means;
the recorder further comprises marking means for [creating]
writing the medium mark on the information carrier;

the jenerator means [include means for generating] generate the first bitpattern from a seed according to a further predefined relationship; and

the generator means are arranged for generating the first bitpattern by combining a first part represented by a prepressed mark on a recordable information carrier and a second part

generated from the seed [;].

16. (twice amended) The information carrier of claim 9, in which:

the relationship includes a cryptographic [one-way] function [that when applied to the first bitpattern, reproduces the second bit pattern);

the relationship includes a one-way function; and the second bitpattern identifies the encoder means.

17. (twice amended) The player of claim 12, in which: [the player further comprises means for reproducing recorded

informat::on from a record carrier;]

the relationship includes a cryptographic one-way function; the relationship includes a one-way function [is applied to the second bit pattern in a process to reproduce the first bitpattern]; and

the second bitpattern identifies the encoder means.

18. (amer.ded) The system of claim 1 in which the medium mark is [written onto a master disk] pressed in the record carrier during manufacture [of the disk].

Please acd the following new claim:

The system of claim 1 in which the watermarked user 19. information is stored on the record carrier in a different manner than the medium mark is stored, the user information writing means being insufficient for writing the medium mark on the record carrier.
